1. Precautions in Use of LCD Module

- (1) Avoid applying excessive shocks to the module or making any alterations or modifications to it.
- (2) Don't make extra holes on the printed circuit board, modify its shape or change the components of LCD Module.
- (3) Don't disassemble the LCM.
- (4) Don't operate it above the absolute maximum rating.
- (5) Don't drop, bend or twist LCM.
- (6) Soldering: only to the I/O terminals.
- (7) Storage: please storage in anti-static electricity container and clean environment.

9. Application circuit

9.1 Interfaces with the 8080 -serial MPU

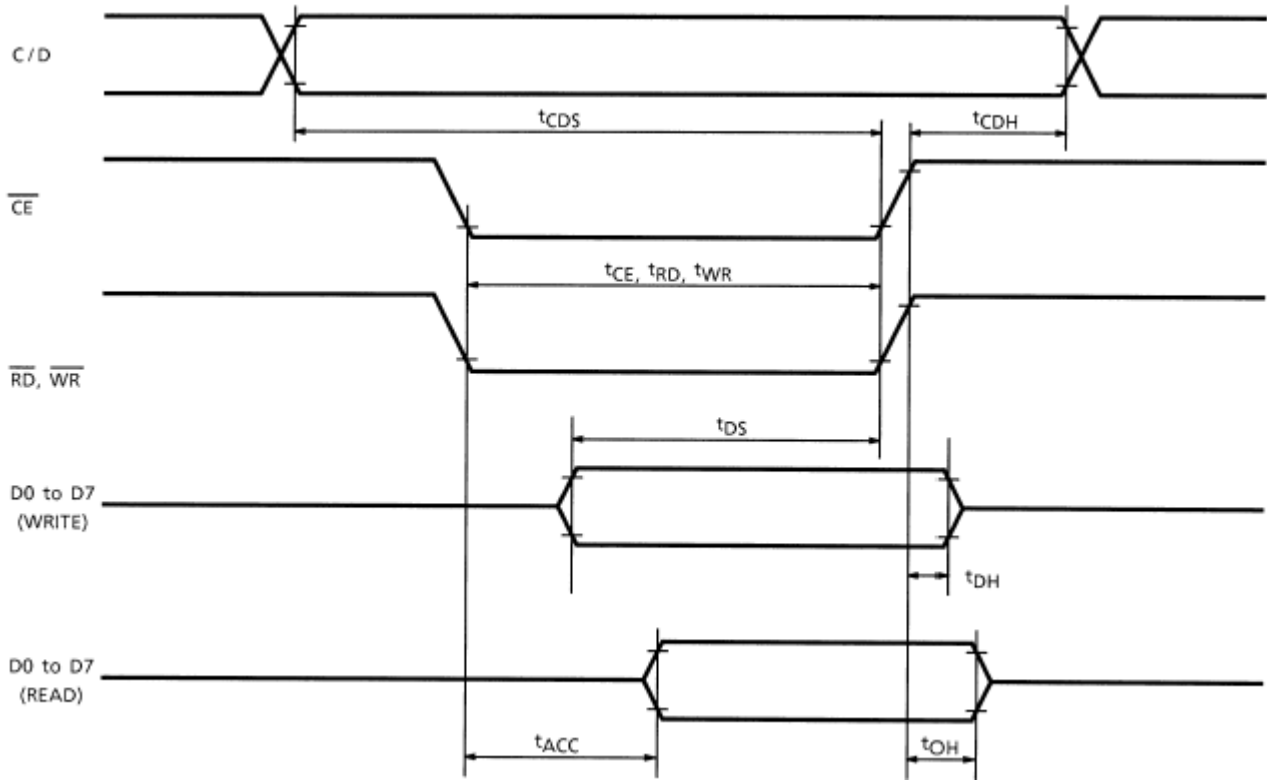

The LCM can be directly connected to a 8080-serial MCU. The LCM can be used with a 8080-serial MPU as shown in the following application circuit.

9.2 Interfaces with the 6800 -serial MPU

10. Timing Characteristics

11.1 Status Read

A status check must be performed before data is read or written.

Status Check

Status of LCM can be read from data lines(Data bus).

RD = L, WR = H, CE = L, C/D = H, D0~D7 → Status word LCM.

The LCM Status word format is as follows.

MSB				LSB			
STA7	STA6	STA5	STA4	STA3	STA2	STA1	STA0
D7	D6	D5	D4	D3	D2	D1	D0
STA0	check capability of command execution				0: disable	1:enable	
STA1	check capability of data read/write				0: disable	1:enable	
STA2	check capability of auto mode data read				0: disable	1:enable	
STA3	check capability of auto mode data write				0: disable	1:enable	
STA4	not use						
STA5	check capability of controller operation				0: disable	1:enable	
STA6	error flag. using screen peek/copy command				0: no error		
STA7	check the condition blink				0: display off	1:normal display	

Note1: It is necessary to check STA0 and STA1 at the same time.

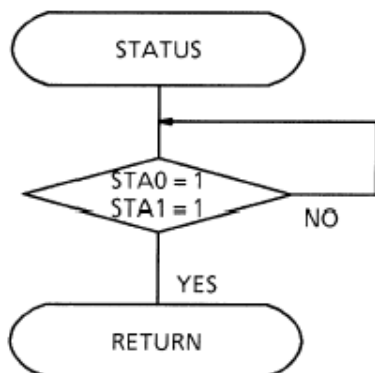

There is a possibility of error operation due to a hardware interrupt.

Note 2. For most modes STA0 / STA1 are used as a status check.

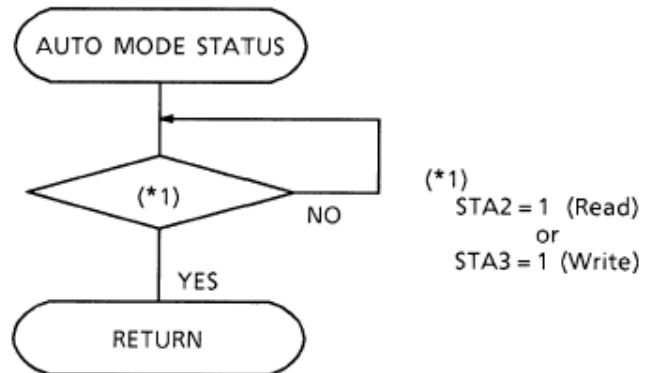

Note 3. STA2/STA3 are valid in Auto mode;STA0/STA1 are invalid.

Status checking flow

a)

b)

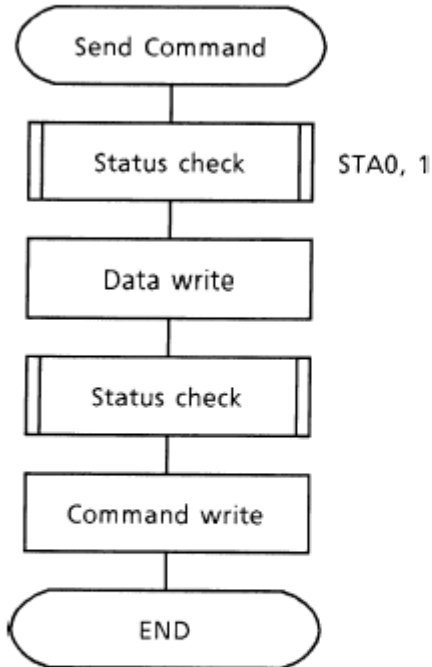

Note 4. It is impossible to save status check in the case of command that is MSB 0. To have the delay time cannot be save status check. The interrupt of hardware is happened at the end of lines. If command of MSB0 is sent in this period, the command executing is waited. The state of waiting is not known without to check status. The sending next command or data is disregarded or rewrites data of waiting command.

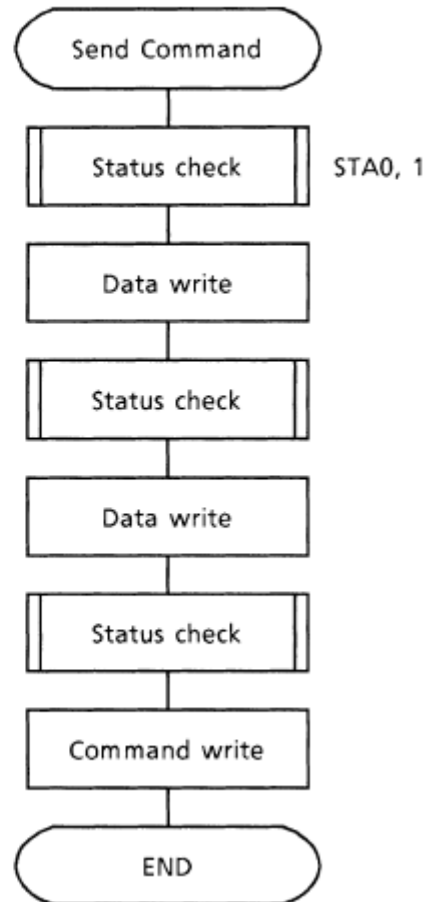

11.2 Data Set

When using the LCM, first set the data(1 or 2 data), then set the command.
 Procedure for sending a command

a) The case of 1 data

b) The case of 2 data

Note: When sending more than two data, the last datum (or last two data) is valid.

12.2 Description of command

12.2.1 Register setting

CODE	HEX	FUNCTION	D1	D2
00100001	21H	CURSOR POINTER SET	X address	Y address
00100010	22H	OFFSET REGISTER SET	DATA(DB0~DB4 is valid)	00H
00100100	24H	ADDRESS POINTER SET	LOW address	HIGH address

(1) CURSOR POINTER SET (D1-D2-21H)

The position of cursor is specified by X address, Y address, The cursor position is moved only by this command. The cursor pointer doesn't have the function of increment and decrement. The shift of cursor are set by this command.

X address, Y address are specified following

X address 00H~4FH (lower 7bits are valid)

Y address 00H~1FH (lower 5bits are valid)

1) 1 screen drive

X ADRS 00~4FH

Y ADRS 00H~0FH

2) 2 screen drive

(2) OFFSET REGISTER SET(D1-00-22H)

The offset register is used to determine external Character Generator RAM area.

The LCM assign External character generator, when character code set 80H to FFH in using internal character generator. Character code 00H to 80H assign External Character Generator, when External generator mode.

The senior five bits define the start address in external memory of the CG RAM area.

The next eight bits represent the character code of the character. In internal CG ROM mode, character codes 00H to 7FH represent the predefined "internal" CG ROM characters, and codes 80H to FFH represent the user's own "external" characters. In external CG RAM mode, all 256 codes from 00H to FFH can be used to represent the user's own characters. The three least significant bits indicate one of the eight rows of eight dots that define the character's shape.

(3) Set Address Pointer(D1-D2-24H)

The address point set command is used to indicate the start address for writing to (or reading from) external RAM.

12.2.2 Control word set

CODE	HEX	FUNCTION	D1	D2
01000000	40H	TEXT HOME ADDRESS SET	Low address	High address

01000010	42H	GRAPHIC HOME ADDRESS SET	Low address	High address
01000011	43H	GRAPHIC AREA SET	Columns	00H

The home address and column size are defined by this command.

(1) Text home address set(D1-D2-40H)

The starting address of external display RAM for Text display is defined by this command. The text home address shows the left end and most upper position.

The relationship of external display RAM address and display position

(3) Text area set (D1-00-41H)

The columns of display are defined by the hardware setting. This command can be used to adjust columns of display.

(example) LCD size: 20 columns, 4 lines

Text home address = 0000H Text area = 0014H
 CL=32 columns 4 lines

0000	0001	0013	0014	001F

(4) Graphic area set (D1-00-43H)

The columns of display are defined by the hardware setting. This command can be used to adjust columns of graphic display.

(example)

LCD size: 20 columns, 2 lines
 Graphic home address= 0000H Graphic area = 0014H

0128	0129	013B	012C	0137
013C	013D	014F	0140	014B

The address in graphic area can be continuous and RAM area can be used without ineffective area, if graphic area is defined the same number as the actual column number of LCD display.

12.2.3 Mode set

CODE	FUNCTION	Operand
1000X000	“OR” mode	
1000X001	“EXOR” mode	
1000X011	“AND” mode	
1000X100	“TEXT ATTRIBUTE” mode	
10000XXX	internal character generator mode	
10001XXX	external character generator mode	

X:invalid

The display mode is defined by this command. The display mode doesn't change until this command is sent. Logically “OR”, “EXOR”, “AND” of text and graphic display can be displayed. When internal character generator mode is selected, character code 00H~7FH are selected from built-in character generator RM. The character code 80H~FFH are automatically selected from external character generator RAM.

(example)

Graphic

Text

“OR”

“AND”

“EXOR”

Note: Only text display is attributed, because attribute data is located in graphic RAM area.

Attribute function

“Reverse display”, “Character blink” and “Inhibit” are called “Attribute”. The attribute data is written into the graphic area defined by “Control word set” command. Only text display is possible in Attribute Function mode; graphic display is automatically disabled. However, the Display Mode command must be used to turn both Text and Graphic on in order for the Attribute function to be available.

The attribute data of the 1st character in text area is written at the 1st 1 byte in graphic area, and attribute data of n-th character is written at the n-th 1 byte in graphic area.

Attribute function is defined as follows:

Attribute RAM 1 Byte	X	X	X	X	d3	d2	d1	d0
----------------------	---	---	---	---	----	----	----	----

d3	d2	d1	d0	FUNCTION
0	0	0	0	normal display
0	1	0	1	reverse display
0	0	1	1	inhibit display
1	0	0	0	blink of normal display
1	1	0	1	blink of reverse display
1	0	1	1	blink of inhibit display

X: don't care

12.2.4 Display mode

CODE	FUNCTION	Operand
10010000	display off	
1001XX10	cursor on, blink off	
1001XX11	cursor on, blink on	
100101XX	text on, graphic off	
100110XX	text off, graphic on	
100111XX	text on, graphic on	

Note: It is necessary to turn on “text” display“ and ”graphic display“ in following case.

- 1) Combination of text/graphic display
- 2) Attribute function

12.2.5 Cursor pattern select

CODE FUNCTION

A0H~A7H 1~8 line cursor

When cursor display is ON, this command selects the cursor pattern from 1 line to 8 lines. The cursor address is defined by cursor pointer set command.

1 line cursor

2 lines cursor

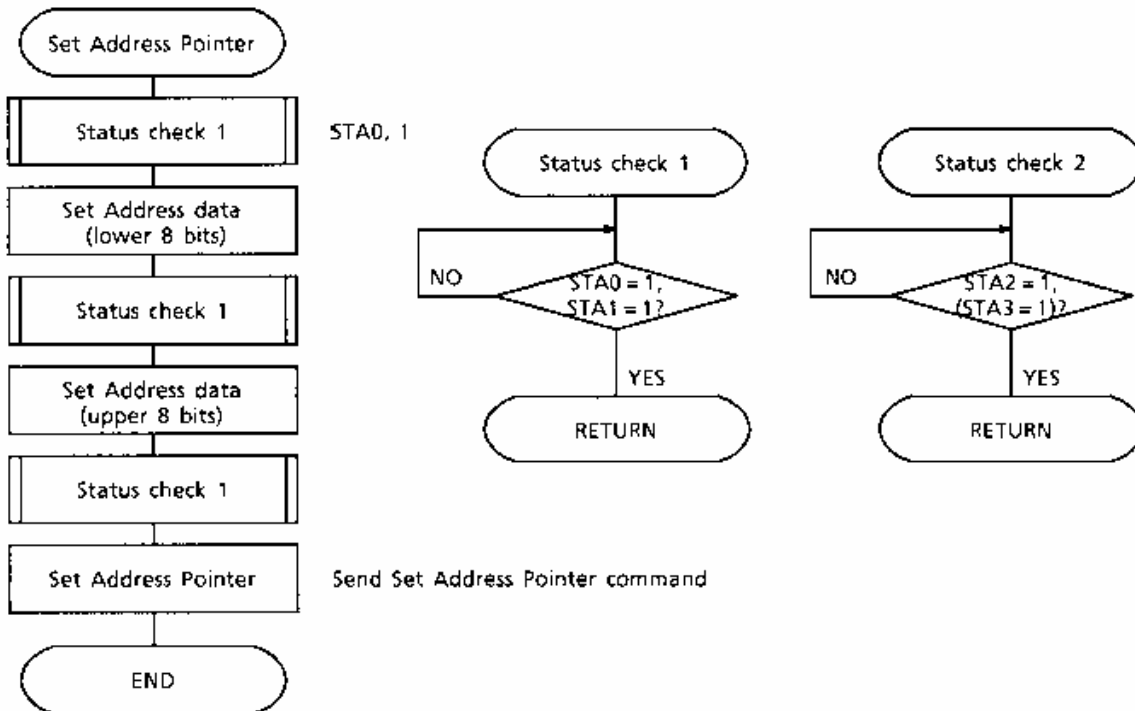

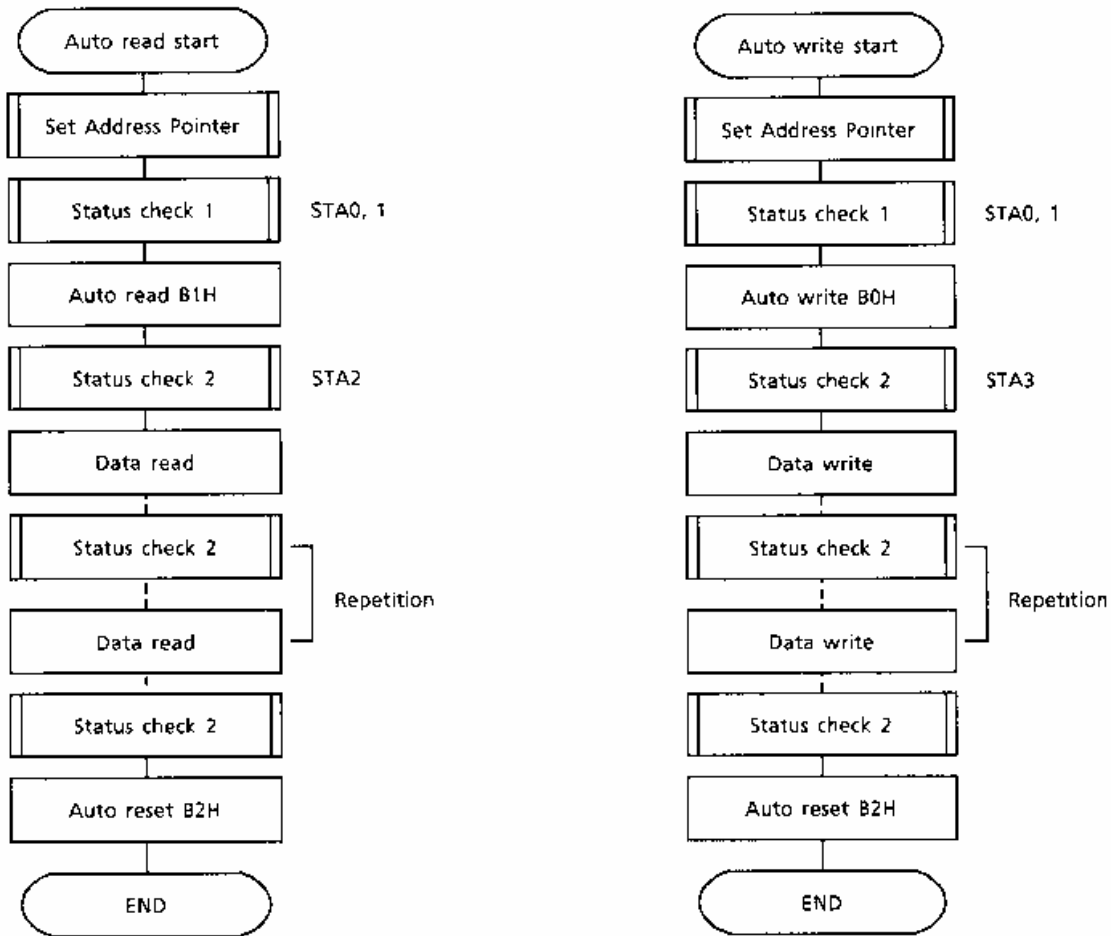

8 lines cursor

12.2.6 Data auto read/write

CODE(BIN)	CODE(HEX)	FUNCTION	Operand
10110000	B0H	Data auto write set	---
10110001	B1H	Data auto read set	---
10110010	B2H	EXIT auto operation	---

This command is convenient to send full screen data from external display RAM. After setting auto mode, “data write (or read)” command is not necessary between each data. “Data auto write (or read)” command should follow the “Address pointer set” and address pointer is automatically increment by +1 after each data “auto reset” is necessary to return normal operation because all data is regarded “display data” and no command can be accepted in the auto mode.

Note: A Status check for auto mode (STA2, STA3 should be checked between each data. Auto reset should be performed after checking STA3=1 (STA2=1). Refer following flow chart.

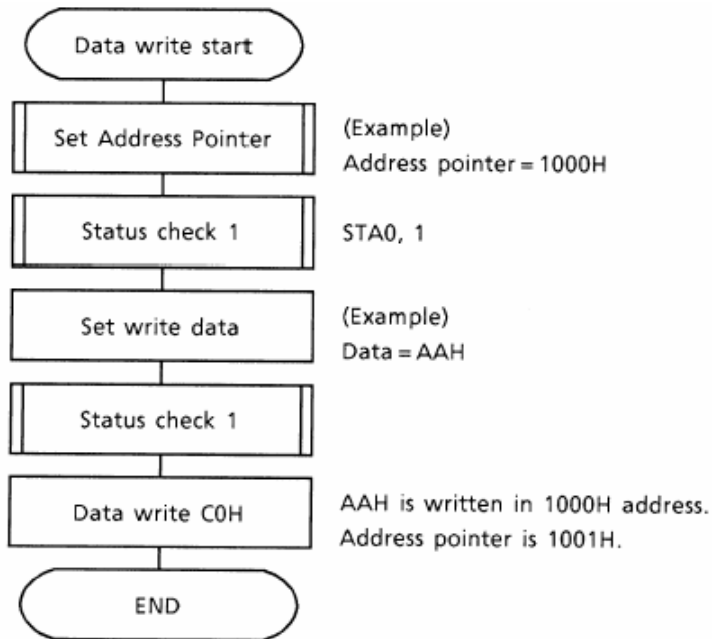

12.2.7 Data read write

CODE(BIN)	CODE(HEX)	FUNCTION	Operand
11000000	C0H	Data Write and Increment ADP	data
11000001	C1H	Data Read and Increment ADP	-
11000010	C2H	Data Write and Decrement ADP	data
11000011	C3H	Data Read and Decrement ADP	-
11000100	C4H	Data Write and Nonvariable ADP	data
11000101	C5H	Data Read and Nonvariable ADP	-

This command is used for data write from MPU to external display RAM to MPU. Data write/read should be executed after setting address by address pointer can be automatically increment or decrement by setting this command.

Note: This command is necessary for each 1 byte data.

Refer following flow chart.

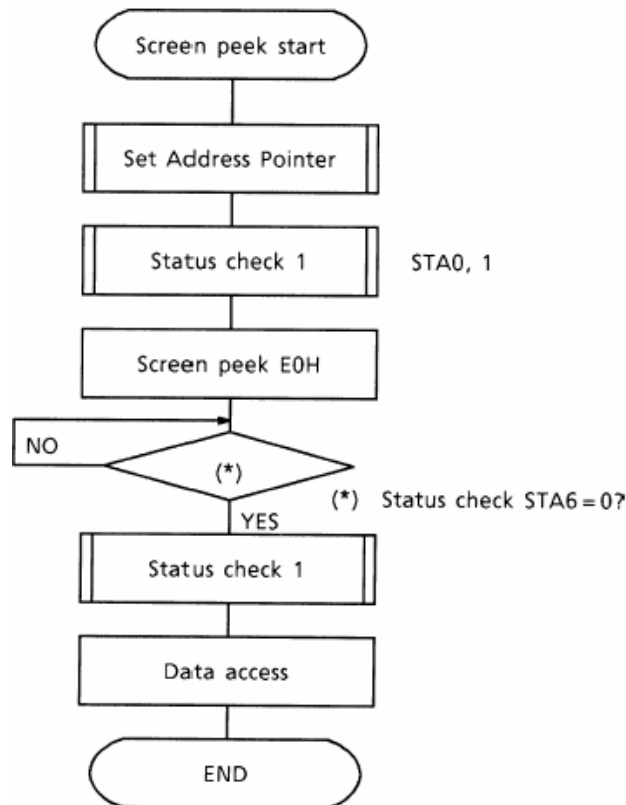

12.2.8 Screen peek

CODE(BIN)	CODE(HEX)	FUNCTION	Operand
11100000	E0H	screen peek	---

This command is used to transfer displayed 1 byte data to data stack, and this 1 byte data can be read from MPU by data access.

The logical combination data of text and graphic display on LCD screen can be read by this command. The status (STA6) should be checked just after “screen peek” command. If the address command is not in graphic area, this command ignored and status flag (STA6) is set.

Refer following flow chart.

Note: This command is available when hardware column number and software column number are the same.

Hardware column number is related to jumper “J1” setting. **Default: CL=32.**

Software column number is related to Set Text Area and Set Graphic Area command.

12.2.9 Screen copy

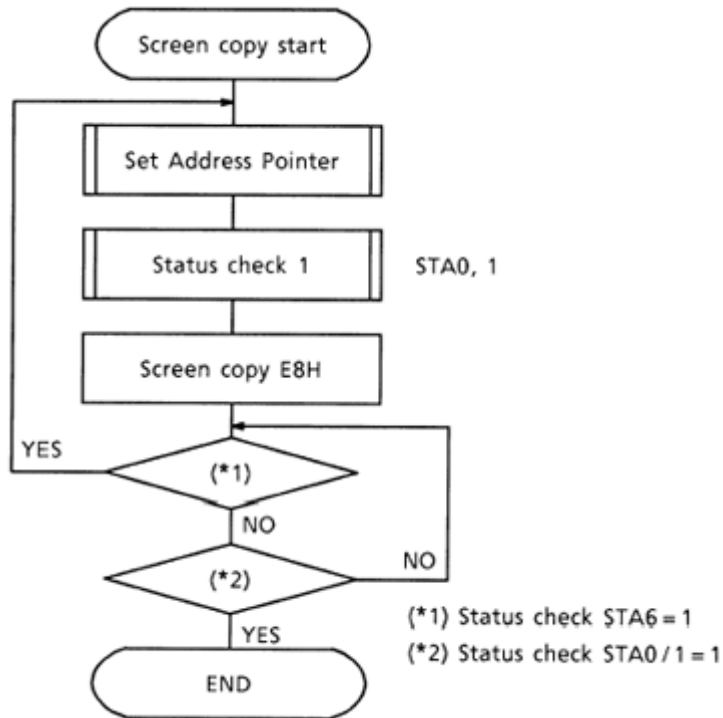

CODE(BIN)	CODE(HEX)	FUNCTION	Operand
11101000	E8H	screen copy	---

This command is used to copy displayed 1 line data to graphic area. The start point of 1 line data in the screen is determined by the address pointer.

Note:a) When the attribute of text is used this command cannot be used. (because attribute data is in the graphic area.)

b) In case of 2 screen drive, this command cannot be used. (because T6963c cannot separate upper screen data and lower screen data.)

Refer following flow chart.

Note: This command is available when hardware column number and software column number are the same.

Hardware column number is related to jumper “J1” setting. **Default: CL=32.**

Software column number is related to Set Text Area and Set Graphic Area command.

12.2.10 Bit set/reset

FUNCTION	CODE(BIN)	CODE(HEX)	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7
Bit reset	11110XXX	F0H~F7H	F0H	F1H	F2H	F3H	F4H	F5H	F6H	F7H
Bit set	11111XXX	F8H~FFH	F8H	F9H	FAH	FBH	FCH	FDH	FEH	FFH

This command is used to set or reset a bit of 1 byte is specified by address pointer. Plural bits in the 1 byte data cannot be set/reset at a time.

13. Initializing flow chart

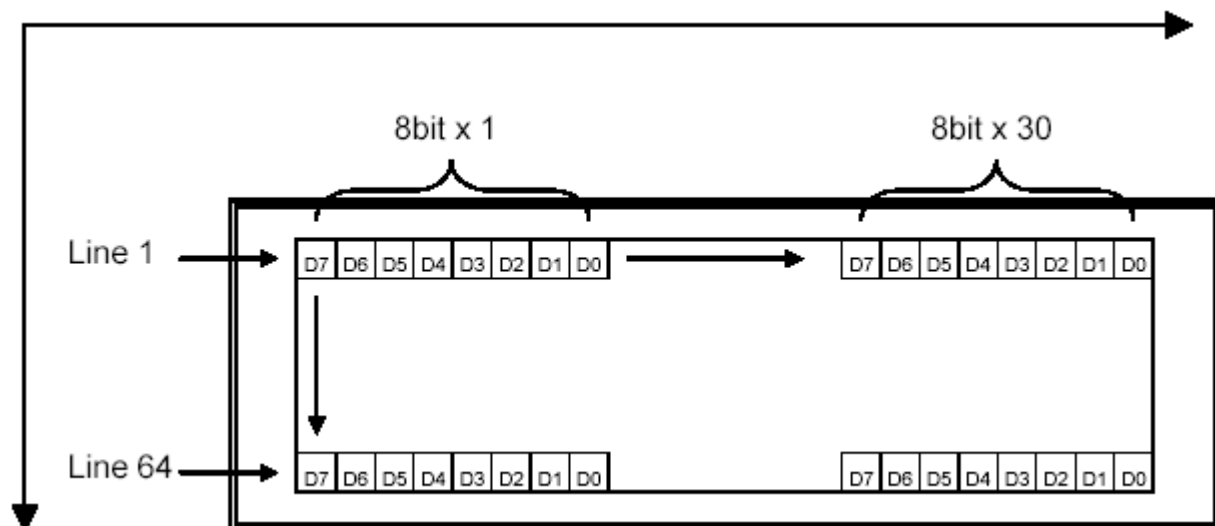

Initialize of LCM is required for “Mode set”, “Control word set” after power on. Following is the one example of initialize procedure of 240x64 dots display (In case of 6x8 dots/font: FS=H).

Command	C/D	D7 -----D0	Note
Power on	Power on		
Hard reset (use reset terminal)	RESET="L" (1msec minimum after VDD>4.75V)		
Mode set	1	1 0 0 0 0 0 0 0	“OR” mode

Note:

1. “status check” should be inserted between all command and data.
2. Display mode set register is cleared (no display mode) by the hard reset , and no display is appeared on LCD panel. And just after “Display Mode set 9CH”, written data is display on the LCD.
